

Designing Your Home.....

Stage 1 - Feasibility study

We provide a comprehensive service starting with consultation and brief formulation, followed by sketch design feasibility proposals.

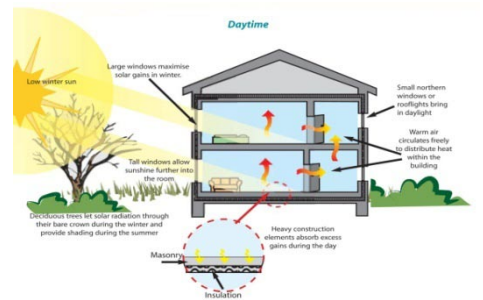

Stage 2 - Detailed design-Planning permission

The bespoke design progresses to detailed drawings and specification. At this stage a 3D model is constructed and drawings submitted to planning.

Stage 3 - Energy Conscious Design & Passive House Standards

As part of our design service we offer client the opportunity to upgrade the specification materials and technology to create highly energy efficient dwellings. This has the advantage of reducing running cost and reducing Co2 emissions for the lifetime of the dwelling.

Stage 4 - Building control submission

Accurate calculations and specification determine an 'eco' design or 'A-rated' dwelling. The project may then be tendered for pricing purposes and construction may begin on site.

Stage 5 - Tender Construction

The project may then be tendered for pricing purposes and construction may begin on site

Stage 6 - Building supervision

The project is certified and professionally supervised on site by a qualified architect.
